

# Tokenized access to CO<sub>2</sub> offsetting

BlackCarbonX is a blockchain-based carbon platform that gives companies and individuals simple access to verified CO<sub>2</sub> offsets and audit-ready ESG documentation. Through the BCBX utility token, users can fund and retire certified carbon credits, track their climate impact in real time, and download compliance-friendly reports from a single interface. Instead of navigating registries, brokers, and spreadsheets, BlackCarbonX bundles sourcing, retirement, and reporting into one programmable infrastructure layer for digital climate action.

## The ecosystem

### Carbon certificate reserve

BlackCarbonX is backed by a professionally managed reserve of verified CO<sub>2</sub> certificates and liquid assets. We acquire high-quality credits at advantageous prices and hold them in custody as the strategic backbone of the ecosystem.

### Offsetting and token retirement

When users spend BCBX to offset emissions, tokens are permanently retired and matching CO<sub>2</sub> certificates from the reserve are cancelled in the respective registry. This turns digital tokens into real, verifiable climate action.

### The BCBX Utility Token

BCBX is the utility token at the heart of the BlackCarbonX ecosystem. It is used to access offsetting services, participate in staking programs, and unlock advanced ESG tools in a single, unified flow.

### A comprehensive ESG Reporting Engine

The ESG Reporting Engine transforms every offset into clean, audit-ready documentation. It is built for companies that need reliable, traceable climate data without adding complexity to their internal workflows.
